

Kimberly O'Neill

(856) 685-0836 | kimberlyo3113@gmail.com | Philadelphia, PA

Backend & Data Engineer with 5+ years building REST/SOAP integrations, ETL data pipelines, and event-driven services across AWS and Salesforce ecosystems. Deep experience integrating enterprise CRM systems with downstream data platforms, banking partners, and AI/ML services (AWS Bedrock). Strong Python and SQL/PostgreSQL background, with a DevOps mindset around CI/CD automation, observability, and agentic development practices (Claude, GitHub Copilot).

TECHNICAL SKILLS

Languages: Python, Java, TypeScript, JavaScript, SQL, Apex

Data & Pipelines: ETL/ELT design, PostgreSQL, data modeling, event-driven architecture, FastAPI, PySpark, Pandas, NumPy, Snowflake

Cloud & Infrastructure: AWS (Lambda, ECS/Fargate, RDS, S3, API Gateway, SQS, SES, Secrets Manager, CloudWatch, Bedrock), Docker, CI/CD (GitHub Actions, Azure Pipelines), Kafka

Integration & CRM: REST API, SOAP API, Salesforce, MuleSoft

Practices & Tools: Git, Agile/Scrum, Jira, Postman, VS Code, Claude, GitHub Copilot

PROFESSIONAL EXPERIENCE

Senior Software Engineer — *Reliance Matrix*

June 2025 – Current

- Designed and built object-oriented backend services (Java, Python) and REST integrations for a national insurance provider's claims, member services, and payments systems.
- Built a Member Hub service (Java, REST, React) to unify identity, deduplicate records, and securely transmit payment data to a downstream banking partner.
- Developed integration logic to process and classify documents via REST, applying structured metadata and business rules.
- Architected an LLM-powered analytics platform natively within Salesforce, integrating AWS Bedrock to perform real-time sentiment, risk, and category classification.
- Maintained and extended enterprise applications (Typescript, Java, Python) through feature development, bug fixes, refactoring, and technology upgrades.
- Directed a development team delivering an automation initiative end-to-end, including code review and release standards.
- Implemented CI/CD pipeline using Github workflows to automate releases across dev, QA, UAT, and Production.
- Leveraged Claude and GitHub Copilot to accelerate development velocity, using AI pair-programming for code generation, debugging, and refactoring across Python and Salesforce codebases.

Senior Software Developer — *Macquarie*

Aug 2021 – June 2025

- Wrote object-oriented backend logic (Java, Python) and components across six enterprise systems supporting public and private markets.
- Built a data integration pipeline (Python, AWS, Docker) to import and reconcile product data across environments, eliminating 30+ hours of manual work monthly.
- Developed visual reporting components using Javascript and HTML.
- Led modernization of a legacy platform, replacing manual workflows with modular, reusable backend components and creating interactive UIs with React.
- Upgraded locally ran processes to AWS workflows to transition to horizontally scaling cloud architecture.

PROJECTS

Document Automation Service (Python, AWS, React)

- Built a Python service orchestrating high-volume REST calls with retry, pagination, and rate-limit handling.
- Created a UI with React for ease of use with non-technical users.
- Converted the solution to a platform event-driven architecture triggering an AWS-hosted service for async processing.

Salesforce toolkit (Python)

- Designed and built a Python CLI toolkit wrapping the Salesforce CLI to automate test data provisioning, reusable Apex script execution, and cross-org metadata comparison for Salesforce development workflows.
- Created org-comparison tool that diffs metadata between environments to detect deployment conflicts before they occur, addressing recurring merge conflicts caused by high-frequency third-party changes to a shared QA org.

EDUCATION & CERTIFICATIONS

B.S. in Software Engineering, Minor in Criminal Justice — Shippensburg University, ABET Accredited, May 2021
